Zeros of Eisenstein Series and Weakly Holomorphic Forms

Abstract: When given a complex function, one of the most natural questions is that of the locations of the zeros. For form is
er, most modular forms have many zeros inside a fundamental
is known about the zeros of a general form, there have been
cyclic forms or families of forms. In these talks, we discuss the
and Swinnerton-Dyer about the zeros of Eisenstein series and of
about certain weakly holomorphic modular forms. Specifically,
that all of the zeros lie on the unit circle.
